

## BRIGHT LIGHTS COSMOS

Cosmos are showy, lovely and easy to grow. The Spanish priests grew Cosmos in their mission gardens. They are named Cosmos, the Greek word for harmony, because of their evenly placed petals.

### Planting Instructions:

Plant seeds about 1/4th inch deep in early Spring. They like full sun. Water sparingly after seedlings appear. Cosmos can grow in poor soil and they love hot sun. Once they get started, they require little care and little water. What's not to like?

### FRENCH MARIGOLD MIX

Marigolds are easy to grow, bloom all summer and have few insect or disease problems. It was once sought after for its medicinal qualities—to comfort both heart and spirit.

**Planting Instructions:**

Sow seeds after frost in sunny area. Thin out seedlings 9-10 inches apart so branches have room to spread. Plants will bloom all summer until frost.

## GENOVESE BASIL

In Italy, basil is considered a sign of love. Here on the farm it is definitely the sign of love of food, since this basil makes the very best pesto. Basil is best when it is young and growing quickly, so keep your basil plants trimmed and you will always have new young leaves for cooking and you can also make a herbal bouquet for your favorite chef.

### Planting Instructions:

Plant seeds about ¼ inch deep in the Spring. They like full sun or partial shade. Keep evenly moist for 1-2 weeks while they germinate. You can plant basil near tomatoes and peppers to enhance their growth. Do not let it flower; keep flowers trimmed off to encourage tasty new leaf growth.

### MORNING GLORY MIX

Morning Glory is found wild throughout Europe, in Siberia, China, Persia, and India. It was introduced into North America many years ago. It has a long period of blooming, generally from June to frost. It makes a beautiful screen or a garden decoration since it is a vine and will twine around a trellis or climb an arbor of small diameter. It grows quickly and can make a complete revolution around the object in 1 ¾ hours!

#### Planting Instructions:

Plant seeds about ½ inch deep about 6 inches apart, in the Spring. Since they are a vine, plant close to a trellis or something they can climb on. Three or four plants per trellis makes a beautiful dense green area dotted with beautiful flowers.

## CALIFORNIA POPPY

The song laments that, “all the gold is in California, in a bank in someone else’s name.” Well, it isn’t true. It is on the hills and along the road and everywhere in the spring and summer when the California Poppy blooms. This beautiful bright yellow-gold flower, the state flower of California, is perfect to add some gold to your garden or driveway or a field or empty lot near your house. They worship the sun, like many Californians, opening in the morning and closing at night.

### Planting Instructions:

Sprinkle the seeds thinly on the ground and scratch in with a rake or even just your foot; they need to be close to the surface to germinate. They don’t transplant well, but can be transplanted when very young. Be sure the soil is kept moist for a week or so. They like full sun and are annuals and self-seeding, so once they start you will have your fair share of California gold, for a long time

## MUSTARD

The tiny mustard seed has been celebrated since ancient times. It grows all winter and brightens the spring with its brilliant yellow flowers. It is planted in the vineyards and grows wild on the hills of the Napa Valley. The joy of beautiful fields of yellow mustard flowers is celebrated each Spring with a Mustard Festival; food, wine and fun for everyone.

The mustard leaves, when the plant is young, can be used as soup greens or sauté with garlic and fresh olive oil for a robust and tasty side dish.

### Planting instructions:

The seeds should be sprinkled on the ground then either lightly raked back and forth or covered lightly with about 1/8 inch of soil. They need to be very close to the surface to start to grow. Keep the soil evenly moist.

## SCARLET RUNNER BEANS

**P**ole Beans grow as a vine and need support to produce the best crops. They are indeterminate meaning they continue to grow, flower, and produce pods over about an 8 week period. For fresh green beans they should be picked young, certainly before the bean starts to bulge inside the pod. Beans must be picked to keep producing. If some are allowed to go to seed, production will stop.

### Planting Instructions:

Plant seeds about 1 inch deep about 4-6 inches apart, in the Spring after risk of frost. They need to be planted by a trellis or some type of support at least 5-6 feet tall. Water low at sowing time, medium at flowering and heavy through harvest. They like full sun.

## HOLLYHOCK MIX

Hollyhocks are great fun. They grow tall and proud, and profuse with a brilliant stalk of flowers. They brighten the family vegetable garden plots in most European countries. They are a big plant (4-5 feet tall), so give them a lot of room. They have brilliant pink and purple flowers in the late spring, and all through the summer into fall.

These seeds are from the Hollyhocks we grew, hand gathered and dried on our little farm in Yountville, California. We love sharing them with people who will give them a loving home. Please enjoy planting and growing them and watching them bloom.

### Planting Instructions:

Place the seeds on the top of some dirt. Cover them with more dirt, about ½ inch. Water them; the rest is their job. They like water, but have deep roots; so can withstand drying out at times. Semi-sun to full sun is fine. They can be perennials, if it doesn't get too cold, so plant them in a permanent location. They will also definitely reseed themselves.

## MUSQUEE DE PROVENCE PUMPKIN

We think Cinderella would have chosen this beautiful heirloom pumpkin from France to turn into a carriage for the Ball. Afterward, she could have turned the pumpkin into a wonderful soup.

These elegant pumpkins grow to 25-30 pounds. They have a thick, bright orange, silky and tasty flesh.

### Planting instructions:

Place 2-3 seeds about 5 inches apart in a 1 foot diameter area. Cover with 1 inch of well amended soil, to create a slight hill. When the plants are about 4 inches tall, thin them to 1 or 2 of the strongest plants per hill. Place hills 5 feet apart in all directions. Pumpkins like full sun, rich soil and enough water so their leaves don't droop. That's it, stand back; they will grow and grow and grow.

## SUNFLOWER MIX

Everyone's favorite, big, bright, happy and fun. This mixture of sunflower seeds has a range of colors, shapes and sizes and is perfect for a sunny garden spot. These sunflowers will grow tall, very tall, so put them where they won't crowd or shade the rest of your garden. If these sunflowers have enough room, at least 2 feet from each other, they will grow very wide and produce flowers all the way up as it grows (especially if you remove the center flower when it starts to appear), sort of a sunflower tree. And the birds will love the seeds in the fall.

### Planting Instructions:

Plant in the Spring. Loosely cover the seeds about ½ to 1 inch deep with soil and keep them moist. Plant at least 12 inches apart. The biggest seeds make the biggest sunflowers, so those can be even further apart. Don't worry; no matter how you plant them, they will grow. They like full sun. Don't over water, the soil should be moist, but should dry out some now and then.

### JERSEY GIRL ASPARAGUS

Asparagus is a perennial and a typical bed can remain productive for 15-20 years so choose your site carefully!! Tender loving care results in an abundant harvest of delicious spring treats! You can harvest the 3rd spring after planting.

Seed depth: ¼"-½", 18" apart

Plant seeds in spring 3 weeks before last frost. Water heavily – at least 4 hours full sun per day

Good companions: basil, calendula, parsley

Bad companions: onion, chive, garlic, leek

## GIANT ZINNIA MIX

Hot weather and Zinnias make a great pair! They come in many hues and sizes. Zinnias are easy to care for and grow in any soil. Sow directly in soil in early spring. Provides color in the garden through frost.

## AMARYNTH

Amarynth is thought to originate in Mexico as a food plant. In the far east and India several species are cultivated as vegetables as their seeds contain more high quality protein than wheat.

Plant in autumn, 1/8" deep.
